

Python Function Practice with Sophistication

1. Write a function `f1(list)` that will return the number of odd elements in a given list.

```
>>> f1([1,2,3,4])
```

```
2
```

```
>>> f1([1,2,3,4,5])
```

```
3
```

```
def f1(li):  
    num = 0  
    for i in li:  
        if i % 2 == 1:  
            num +=1  
    return num
```

2. Write a function `f2(list)` that will print each odd element in a given list.

```
>>> f2([1,2,3,4])
```

```
1
```

```
3
```

```
>>> f2([1,2,3,4,5])
```

```
1
```

```
3
```

```
5
```

```
def f2(list):  
    for i in range(0, len(list)):  
        if list[i] % 2 == 1:  
            print(list[i])
```

3. Write a function `f3(list)` that will return the sum of all odd elements in a given list.

```
>>> f3([1,2,3,4])
```

```
4
```

```
>>> f3([1,2,3,4,5])
```

```
9
```

Show Solution

```
def f3(list):  
    sum = 0  
    for i in range(0, len(list)):  
        if list[i] % 2 == 1:  
            sum = sum + list[i]  
    return sum
```

4. Write a function `f4(list)` that will return the sum of all the index positions whose corresponding element is odd in a given list.

```
>>> f4([1,2,3,4])
```

```
2
```

```
>>> f4([1,2,3,4,5])
```

```
6
```

Show Solution

```
def f4(list):  
    sum = 0  
    for i in range(0, len(list)):  
        if list[i] % 2 == 1:  
            sum = sum + i  
    return sum
```

:

5. Write a function `f5(list)` that will return the same list where each element has been squared.

```
>>> f5([1,2,3,4])  
[1, 4, 9, 16]  
>>> f4([1,2,3,4,5])  
[1, 4, 9, 16, 25]
```

Show Solution

```
def f5(list):  
    for i in range(0, len(list)):  
        list[i] = list[i] ** 2  
    return list
```

6. Write a function `f6(list)` that will return the largest number in a given list

```
>>> f6([1,2,3,4])
```

```
4
```

```
>>> f6([1,2,3,4,5])
```

```
5
```

Show Solution

```
def f6(list):  
    largest = list[0]  
    for i in range(0, len(list)):  
        if largest < list[i]:  
            largest = list[i]  
    return largest
```

7. Write a function `f7(list)` that will return the average of all the numbers in a given list.

```
>>> f7([1,2,3,4])  
2.5  
>>> f7([1,2,3,4,5])  
3.0
```

Show Solutions

```
def f7(list):  
    sum = 0  
    for i in range(0, len(list)):  
        sum = sum + list[i]  
    return sum / len(list)
```

8. Write a function `f8(a, b, n)` that will print all the numbers divisible by `n` within the range `a` and `b` inclusive. Assume `n` is positive.

```
>>> f8(1,10,2)
2
4
6
8
10
>>> f8(1,10,11)
>>> f8(1,10,7)
7
```

Show Solution

```
def f8(n):
    for i in range(a, b+1):
        if i % n == 0:
            print(i)
```

9. Write a function `f9(width,height)` that will print an ASCII rectangle with the given width and height.

```
>>> f9(0,1)
>>> f9(10,0)
>>> f9(1,1)
*
>>> f9(1,2)
*
*
>>> f9(5,5)
*****
*****
*****
*****
*****
```

Show Solution

```
def f9(width, height):
    for i in range(0, height):
        for j in range(0, width):
            print("*", end=" ")
        print()
```

10. Write a function `f10(n)` that will print a triangle with the given height `n`. Assume `n` is nonnegative.

```
>>> f10(1)
```

```
*
```

```
>>> f10(2)
```

```
*
```

```
**
```

```
>>> f10(3)
```

```
*
```

```
**
```

```
***
```

Show Solution

```
def f10(n):  
    for i in range(0, n):  
        for j in range(0, i+1):  
            print("*", end="")  
        print()
```

11. Write a function `f11(list)` that will return `True` if the list is sorted in **descending** order and `False` otherwise. Return `True` for the empty list.

```
>>> f11([])
True
>>> f11([5,4,3,2,1])
True
>>> f11([5,4,3,2,0])
True
>>> f11([5,4,5,2])
False
```

Show Solution

```
def f11(list):
    for i in range(0, len(list)-1):
        if list[i] < list[i+1]:
            return False
    return True
```

12. Write a function `f12(list)` that will return `True` if the list consists of all negative numbers and `False` otherwise. Return `True` for the empty list.

```
>>> f12([])
True
>>> f12([-1,-2,-3,-4,5])
False
>>> f12([1,2,3,4,5])
False
>>> f12([-1,-2,-3])
True
```

Show Solution

```
def f12(list):
    for i in range(0, len(list)):
        if list[i] > 0:
            return False
    return True
```

13. Write a function `f13(list,target)` that will return the index of the last occurrence of `target` in the `list`. Assume the `list` is nonempty and always contains the `target`.

```
>>> f13([1,2,3], 3)
2
>>> f13([1,2,3,1,2,3], 3)
5
>>> f13([1,1,1,1], 1)
3
```

Show Solution

```
def f13(list, target):
    last_index = 0
    for i in range(0, len(list)):
        if list[i] == target:
            last_index = i
    return last_index
```

14. Write a function `f14(list)` that will return the index of the last negative number in the list. Assume the list is nonempty and always contains a negative number.

```
>>> f14([1,2,-3])
2
>>> f14([1,-2,-3,1,-2,-3])
5
>>> f14([-1,1,1,1])
0
```

Show Solution

```
def f14(list):
    last_index = 0
    for i in range(0, len(list)):
        if list[i] < 0:
            last_index = i
    return last_index
```

15. Write a function `f15(list)` that will return the sum of all the elements at even index positions.

```
>>> f15([1,2,-3])  
-2  
>>> f15([1,-2,-3,1,-2,-3])  
-4  
>>> f15([-1,1,1,1])  
0
```

Show Solution

```
def f15(list):  
    i = 0  
    sum = 0  
    while i < len(list):  
        sum = sum + list[i]  
        i = i + 2  
    return sum
```

16. Write a function f16(n) that will print out an upside down triangle.

```
>>> f16(3)
```

```
***
```

```
**
```

```
*
```

```
>>> f16(2)
```

```
**
```

```
*
```

```
>>> f16(1)
```

```
*
```

Show Solution

```
def f16(n):  
    for i in range(0, n):  
        for j in range(0, n-i):  
            print("*", end="")  
        print()
```

17. Write a function `f17(list)` that will print out every other element in a list in reverse order.

```
>>> f17([1,2,3,4,5,6])
6
4
2
>>> f17([1,2,3,4])
4
2
>>> f17([1])
1
```

Show Solution

```
def f17(list):
    i = len(list)-1
    while i >= 0:
        print(list[i])
        i = i - 2
```

18. Write a function `f18(n)` that will return $n!$

```
>>> f18(0)
```

```
1
```

```
>>> f18(2)
```

```
2
```

```
>>> f18(3)
```

```
6
```

Show Solution

```
def f18(n):  
    factorial = 1  
    for i in range(1, n+1):  
        factorial = factorial * i  
    return factorial
```

19. Write a function `f19(matrix)` that will print the sum of each row of the matrix.

```
>>> f19([[1,0],[0,1]])
1
1
>>> f19([[1,2,3],[4,5,6]])
6
15
>>> f19([[1],[2],[3],[4]])
1
2
3
4
```

Show Solution

```
def f19(matrix):
    for row in range(0, len(matrix)):
        sum = 0
        for col in range(0, len(matrix[row])):
            sum = sum + matrix[row][col]
        print(sum)
```

20. Write a function `f20(matrix)` that will print the diagonals of the matrix. Assume the matrix is a square.

```
>>> f20([[1,0],[0,1]])
1
1
>>> f20([[1,2,3],[4,5,6],[7,8,9]])
1
5
9
>>> f20([[1]])
1
```

Show Solution

```
def f20(matrix):
    for row in range(0, len(matrix)):
        for col in range(0, len(matrix[row])):
            if row == col:
                print(matrix[row][col])
```

21. Write a function `f21(list)` that will print the factorial of each element of a given list.

```
>>> f21([])
>>> f21([1,2,3])
1
2
6
>>> f21([1,2,3,4])
1
2
6
24
```

Show Solution

```
def f21(list):
    for i in range(0, len(list)):
        factorial = 1
        for j in range(1, list[i]+1):
            factorial = factorial * j
        print(factorial)
```

22. Write a function `f22(list)` that will print a countdown starting from each element to zero for a given list.

```
>>> f22([])
>>> f22([1,3,5])
1 0
3 2 1 0
5 4 3 2 1 0
>>> f22([5,3,6,2])
5 4 3 2 1 0
3 2 1 0
6 5 4 3 2 1 0
2 1 0
```

Show Solution

```
def f22(list):
    for i in range(0, len(list)):
        countdown = list[i]
        while countdown >= 0:
            print(countdown, end=" ")
            countdown = countdown - 1
        print()
```

23. Write a function `f23(list1, list2)` that will return a new list where each index in the new list corresponds to `|list1[index] + list2[index]|`. Assume `|list1|` and `|list2|` are the same length.

```
>>> f23([], [])  
[]  
>>> f23([1,2,3], [1,2,3])  
[2, 4, 6]  
>>> f23([0,0,0], [1,2,3])  
[1, 2, 3]
```

Show Solution

```
def f23(list1, list2):  
    list3 = []  
    for i in range(0, len(list1)):  
        list3.append(list1[i] + list2[i])  
    return list3
```

24. Write a function `f24(n)` that will print all the numbers from 1 to `|n|` inclusive that is a multiple of 2 or 3.

```
>>> f24(10)
```

```
2
```

```
3
```

```
4
```

```
6
```

```
8
```

```
9
```

```
10
```

```
>>> f24(1)
```

```
>>> f24(3)
```

```
2
```

```
3
```

Show Solution

```
def f24(n):  
    for i in range(1, n+1):  
        if i % 2 == 0 or i % 3 == 0:  
            print(i)
```

25. Write a function `f25(list)` that will return the largest value in the list (of all the nested lists inside `list`). Note that `|list|` is a nested list. Assume `list` starts with a nonempty list.

```
>>> f25([[1,2,3],[4,5,6],[7,8,9]])
9
>>> f25([[3,2,1],[0,-1,-2]])
3
>>> f25([[1,2,3,4],[],[34],[],[],[56],[67]])
67
```

Show Solution

```
def f25(list):
    largest = list[0][0]
    for i in range(0, len(list)):
        for j in range(0, len(list[i])):
            if list[i][j] > largest:
                largest = list[i][j]
    return largest
```

26. Write a function `f26(list)` that will return the second largest value in the list. Assume that the elements of `list` are all unique and it contains at least 2 elements.

```
>>> f26([1,4,3,2,5])
```

```
4
```

```
>>> f26([3,2])
```

```
2
```

```
>>> f26([3,4])
```

```
3
```

Show Solution

```
def f26(list):
    largest = max(list[0], list[1])
    second_largest = min(list[0], list[1])
    for i in range(0, len(list)):
        if list[i] > largest:
            second_largest = largest
            largest = list[i]
        elif list[i] > second_largest:
            second_largest = list[i]
    return second_largest
```

27. Write a function `f27(n)` that will return the leftmost digit in `n`. Assume `n` is positive

```
>>> f27(1234)
```

```
1
```

```
>>> f27(4321)
```

```
4
```

```
>>> f27(3)
```

```
3
```

Show Solution

```
def f27(n):  
    q = n  
    while q >= 10:  
        q = q // 10  
    return q
```

28. Write a function `f28(list)` that will print the largest value of each of the nested lists in the given list. Note that `|list|` is a nested list. Assume each nested list in the given list is not empty.

```
>>> f28([[1,2,3],[4,5,6],[7,8,9]])
3
6
9
>>> f28([[3,2,1],[0,-1,-2]])
3
0
>>> f28([[1,2,3,4],[1],[34],[2],[3],[56],[67]])
4
1
34
2
3
56
67
```

Show Solution

```
def f28(list):
    for i in range(0, len(list)):
        max_value = list[i][0]
        for j in range(0, len(list[i])):
            if max_value < list[i][j]:
                max_value = list[i][j]
    print(max_value)
```
