  - Chapter 18: Parallel Databases
  - Chapter 19: Distributed Databases
- **Part 6: Data Warehousing, Mining, and IR**
  - Chapter 20: Data Mining
  - Chapter 21: Information Retrieval
- **Part 7: Specialty Databases**
  - Chapter 22: Object-Based Databases
  - Chapter 23: XML
- **Part 8: Advanced Topics**
  - Chapter 24: Advanced Application Development
  - Chapter 25: Advanced Data Types
  - Chapter 26: Advanced Transaction Processing
- **Part 9: Case studies**
  - Chapter 27: PostgreSQL
  - Chapter 28: Oracle
  - Chapter 29: IBM DB2 Universal Database
  - Chapter 30: Microsoft SQL Server
- **Online Appendices**
  - Appendix A: Detailed University Schema
  - Appendix B: Advanced Relational Database Model
  - Appendix C: Other Relational Query Languages
  - Appendix D: Network Model
  - Appendix E: Hierarchical Model

Chapter 3: Introduction to SQL

- 3.1 Overview of the SQL Query Language
- 3.2 SQL Data Definition
- 3.3 Basic Structure of SQL Queries
- 3.4 Additional Basic Operations
- 3.5 Set Operations
- 3.6 Null Values
- 3.7 Aggregate Functions
- 3.8 Nested Subqueries
- 3.9 Modification of the Database

History

- IBM Sequel language developed as part of System R project at the IBM San Jose Research Laboratory (1974)
- Renamed Structured Query Language (SQL)
- ANSI and ISO standard SQL:
  - SQL-86
  - SQL-89
  - SQL-92
  - SQL:1999 (language name became Y2K compliant!)
  - SQL:2003
- Commercial systems offer most, if not all, SQL-92 features, plus varying feature sets from later standards and special proprietary features.
  - Not all examples here may work on your particular system.

Chapter 3: Introduction to SQL

- 3.1 Overview of the SQL Query Language
- 3.2 SQL Data Definition
- 3.3 Basic Structure of SQL Queries
- 3.4 Additional Basic Operations
- 3.5 Set Operations
- 3.6 Null Values
- 3.7 Aggregate Functions
- 3.8 Nested Subqueries
- 3.9 Modification of the Database

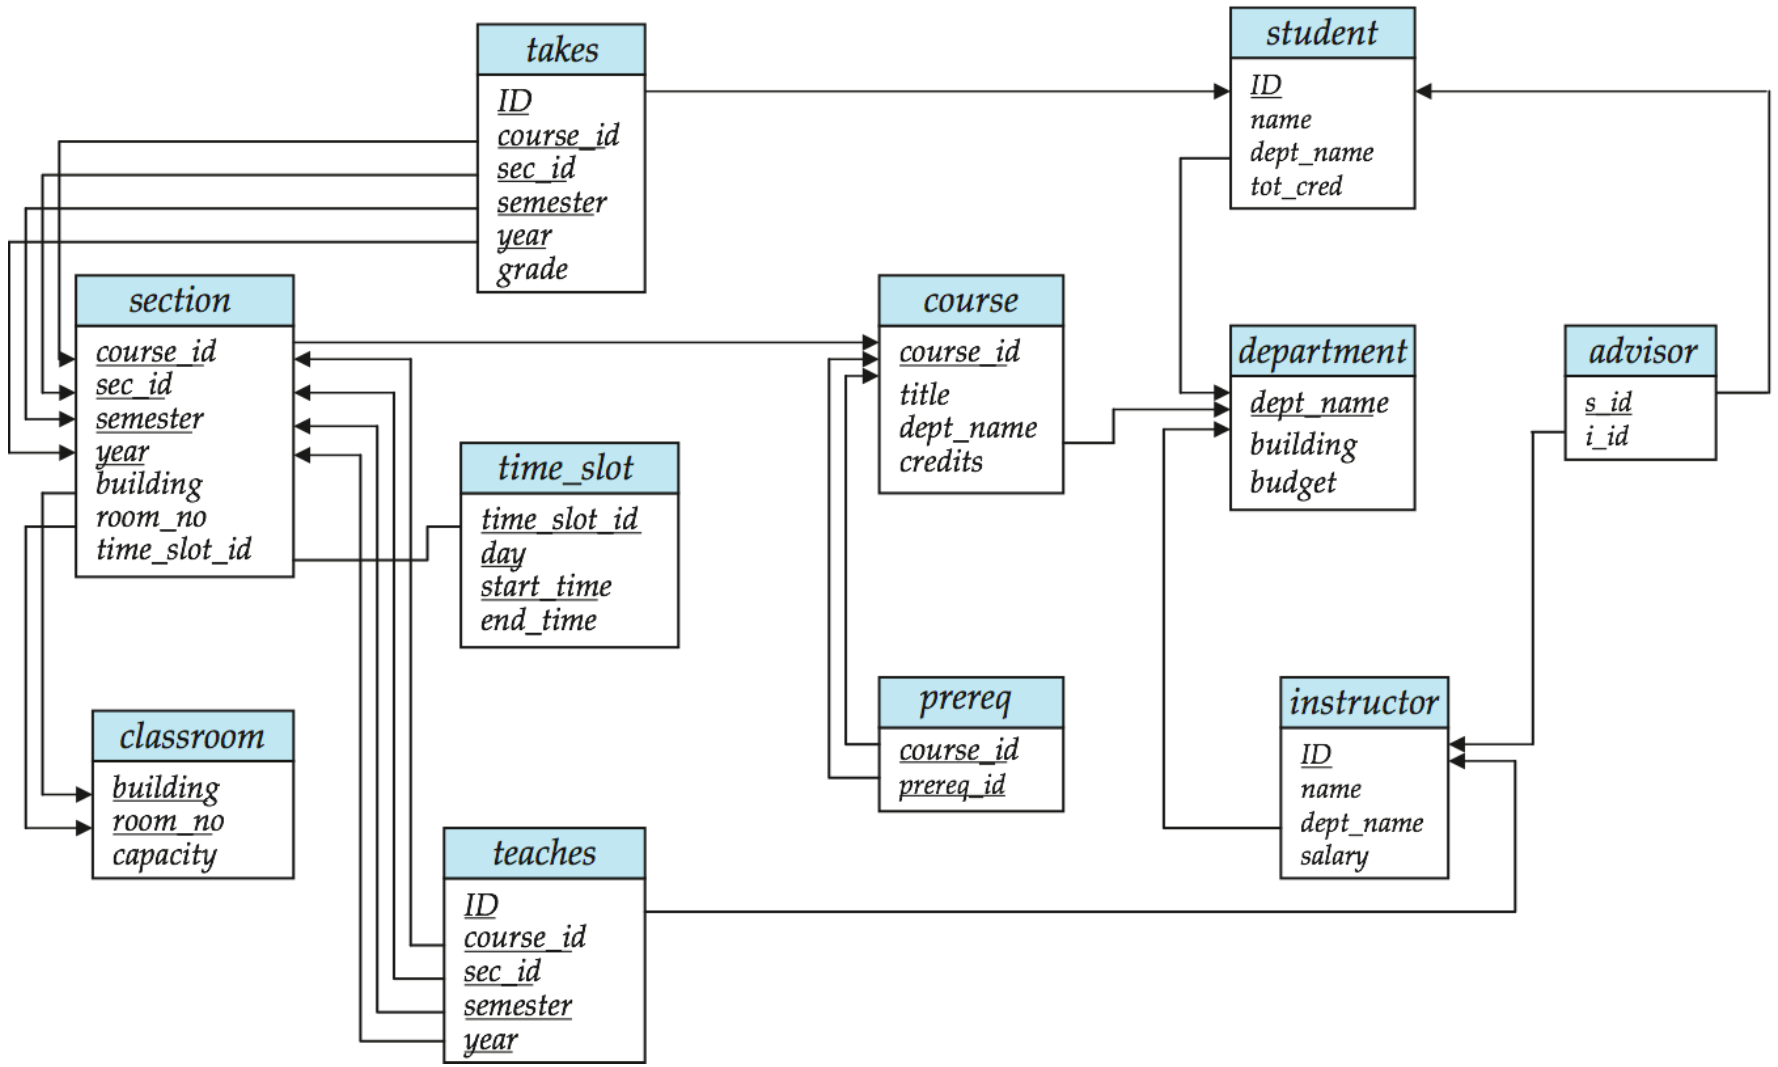
Data Definition Language

- The SQL data-definition language (DDL) allows the specification of information about relations, including:
  - The schema for each relation
  - The domain of values associated with each attribute
  - Integrity constraints
  - And as we will see later, also other information such as
    - The set of indices to be maintained for each relations.
    - Security and authorization information for each relation.
    - The physical storage structure of each relation on disk.

Domain Types in SQL

- **char(n).** Fixed length character string, with user-specified length *n.*
- **varchar(n).** Variable length character strings, with user-specified maximum length *n.*
- **int.** Integer (a finite subset of the integers that is machine-dependent).
- **smallint.** Small integer (a machine-dependent subset of the integer domain type).
- **numeric(p,d).** Fixed point number, with user-specified precision of *p* digits, with *n* digits to the right of decimal point.
- **real, double precision.** Floating point and double-precision floating point numbers, with machine-dependent precision.
- **float(n).** Floating point number, with user-specified precision of at least *n* digits.
- More are covered in Chapter 4.

Schema Diagram for University Database



Create Table Construct

- An SQL relation is defined using the **create table** command:

  create table r (A_1 D_1, A_2 D_2, ..., A_n D_n,
  (integrity-constraint$_1$),
  ...,
  (integrity-constraint$_k$))

  - r is the name of the relation
  - each A_i is an attribute name in the schema of relation r
  - D_i is the data type of values in the domain of attribute A_i

- Example:

  create table *instructor* (
  ID **char**(5),
  name **varchar**(20),
  dept_name **varchar**(20),
  salary **numeric**(8,2))

Integrity Constraints in Create Table

- **not null**
- **primary key** (A_1, ..., A_n)
- **foreign key** (A_m, ..., A_n) **references** *r*

Example: Declare *ID* as the primary key for *instructor*

create table *instructor* (
    ID **char**(5),
    name **varchar**(20) **not null,**
    dept_name **varchar**(20),
    salary **numeric**(8,2),
    primary key (*ID*),
    foreign key *(dept_name*) **references** *department);*

- **primary key** declaration on an attribute automatically ensures **not null**

- **create table** *student* (
    ID **varchar**(5),
    name **varchar**(20) **not null**,
    dept_name **varchar**(20),
    tot_cred **numeric**(3,0),
    primary key *(ID),*
    foreign key *(dept_name*) **references** *department*);

And a Few More Relation Definitions

- **create table** *takes* (
  ID **varchar**(5),
  course_id **varchar**(8),
  sec_id **varchar**(8),
  semester **varchar**(6),
  year **numeric**(4,0),
  grade **varchar**(2),
  primary key *(ID, course_id, sec_id, semester, year)* ,
  foreign key (*ID*) **references** *student,*
  foreign key (*course_id, sec_id, semester, year*) **references** *section*);

  - Note: *sec_id* can be dropped from primary key above, to ensure a student cannot be registered for two sections of the same course in the same semester

- **create table** *course* (
  course_id **varchar**(8),
  title **varchar(**50),
  dept_name **varchar**(20),
  credits **numeric**(2,0),
  primary key *(course_id),*
  foreign key *(dept_name*) **references** *department*);

Updates to tables

- **Insert a tuple**
  - **Insert into** *instructor* **values** (‘10211’, ’Smith’, ’Biology’, 66000);
- **Delete tuples**
  - **delete from** *student* **where** dept_name = ‘Biology’
  - **delete from** r
- **Drop Table**
  - **drop table** *r*
- **Alter** Table
  - **alter table** *r* **add** *A D*
    - where *A* is the name of the attribute to be added to relation *r* and *D* is the domain of *A.*
    - All tuples in the relation are assigned *null* as the value for the new attribute.
  - **alter table** *r* **drop** *A*
    - where *A* is the name of an attribute of relation *r*
    - Dropping of attributes not supported by many databases.

Chapter 3: Introduction to SQL

- 3.1 Overview of the SQL Query Language
- 3.2 SQL Data Definition
- 3.3 Basic Structure of SQL Queries
- 3.4 Additional Basic Operations
- 3.5 Set Operations
- 3.6 Null Values
- 3.7 Aggregate Functions
- 3.8 Nested Subqueries
- 3.9 Modification of the Database

Basic Query Structure

- A typical SQL query has the form:

  select $A_1, A_2, \ldots, A_n$
  from $r_1, r_2, \ldots, r_m$
  where P

  - A_i represents an attribute
  - R_i represents a relation
  - P is a predicate.
- The result of an SQL query is a relation

The select Clause [1/3]

- The **select** clause list the attributes desired in the result of a query
  - corresponds to the projection operation of the relational algebra
- Example: find the names of all instructors:

  select *name*
  from *instructor*

- NOTE: SQL names are case insensitive (i.e., you may use upper- or lower-case letters.)
  - E.g., *Name* ≡ *NAME* ≡ *name*
  - Some people use upper case wherever we use bold font.

The select Clause [2/3]

- SQL allows duplicates in relations as well as in query results.
- To force the elimination of duplicates, insert the keyword **distinct** after select**.**

- Find the department names of all instructors, and remove duplicates

  select distinct *dept_name*
  from *instructor*

- The keyword **all** specifies that duplicates not be removed.

  select all *dept_name*
  from *instructor*

The select Clause [3/3]

- An asterisk in the select clause denotes "all attributes"

  select *
  from *instructor*

- The **select** clause can contain arithmetic expressions involving the operation, +, –, ∗, and /, and operating on constants or attributes of tuples.
- The query:

  select *ID, name, salary/12*
  from *instructor*

  would return a relation that is the same as the *instructor* relation, except that the value of the attribute *salary* is divided by 12.

The where Clause

- The **where** clause specifies conditions that the result must satisfy
  - Corresponds to the selection predicate of the relational algebra.
- To find all instructors in Comp. Sci. dept with salary > 80000

  select *name*
  from *instructor*
  where *dept_name* = 'Comp. Sci.' **and** *salary* > 80000

- Comparison results can be combined using the logical connectives **and, or,** and **not.**
- Comparisons can be applied to results of arithmetic expressions.

The from Clause

- The **from** clause lists the relations involved in the query
  - Corresponds to the Cartesian product operation of the relational algebra.
- Find the Cartesian product *instructor X teaches*

  select *
  from *instructor, teaches*

  - generates every possible instructor – teaches pair, with all attributes from both relations.
- Cartesian product not very useful directly, but useful combined with where-clause condition (selection operation in relational algebra).

Cartesian Product

98345	Kim	Elec. Eng.	80000	EE-181	1	Spring	2009

Natural Join Example

- List the names of instructors along with the course ID of the courses that they taught.

  - **select** *name*, *course_id*
    from *instructor, teaches*
    where *instructor.ID = teaches.ID*;

  - **select** *name*, *course_id*
    from *instructor* **natural join** *teaches*;

instructor

ID	*name*	*dept_name*	*salary*
10101	Srinivasan	Comp. Sci.	65000
12121	Wu	Finance	90000
15151	Mozart	Music	40000
22222	Einstein	Physics	95000
32343	El Said	History	60000

teaches

ID	*course_id*	*sec_id*	*semester*	*year*
10101	CS-101	1	Fall	2009
10101	CS-315	1	Spring	2010
10101	CS-347	1	Fall	2009
12121	FIN-201	1	Spring	2010
15151	MU-199	1	Spring	2010
22222	PHY-101	1	Fall	2009

The Rename Operation

- The SQL allows renaming relations and attributes using the **as** clause:

  old-name **as** *new-name*

- E.g.,
  - **select** *ID, name, salary/12* **as** *monthly_salary*
    from *instructor*

- Find the names of all instructors who have a higher salary than some instructor in 'Comp. Sci'.
  - **select distinct** *T. name*
    from *instructor* **as** *T, instructor* **as** *S*
    where *T.salary > S.salary* **and** *S.dept_name = 'Comp. Sci.'*

- Keyword **as** is optional and may be omitted

  instructor **as** *T* ➔ *instructor T*

String Operations [1/2]

- SQL includes a string-matching operator for comparisons on character strings. The operator **like** uses patterns that are described using two special characters:
  - percent (%) : The % character matches any substring.
  - underscore (_) : The _ character matches any character.

- Find the names of all instructors whose name includes the substring "dar".

  select *name*
  from *instructor*
  where *name* **like** '%dar%'

- Match the string "100%"

  like '100 \%' **escape** '\'

  in that above we use backslash (\) as the escape character.

String Operations [2/2]

- Pattens are case sensitive.
- Pattern matching examples:
  - 'Intro%' matches any string beginning with "Intro".
  - '%Comp' matches any string containing "Comp" as a substring.
  - '_ _ _' matches any string of exactly three characters.
  - '_ _ _ %' matches any string of at least three characters.
- SQL supports a variety of string operations such as
  - concatenation (using "||")
  - converting from upper to lower case (and vice versa)
  - finding string length, extracting substrings, etc.

Ordering the Display of Tuples

- List the names of all instructors in alphabetic order

  select distinct *name*
  from *instructor*
  order by *name*

- We may specify **desc** for descending order or **asc** for ascending order, for each attribute; ascending order is the default.
  - Example: **order by** *name* **desc**
- Can sort on multiple attributes
  - Example: **order by** *dept_name, name*

Where Clause Predicates

- SQL includes a **between** comparison operator
- Example: Find the names of all instructors with salary between \$90,000 and \$100,000 (that is, ≥ \$90,000 and ≤ \$100,000)
  - **select** *name*
    from *instructor*
    where *salary* **between** 90000 **and** 100000
- Tuple comparison
  - **select** *name*, *course_id*
    from *instructor*, *teaches*
    where (*instructor*.*ID*, *dept_name*) = (*teaches*.*ID*, ’Biology’) ;

instructor

ID	*name*	*dept_name*	*salary*
10101	Srinivasan	Comp. Sci.	65000
12121	Wu	Finance	90000
15151	Mozart	Music	40000
22222	Einstein	Physics	95000
32343	El Said	History	60000

teaches

ID	*course_id*	*sec_id*	*semester*	*year*
10101	CS-101	1	Fall	2009
10101	CS-315	1	Spring	2010
10101	CS-347	1	Fall	2009
12121	FIN-201	1	Spring	2010
15151	MU-199	1	Spring	2010
22222	PHY-101	1	Fall	2009

Duplicates [1/2]

- In relations with duplicates, SQL can define how many copies of tuples appear in the result.
- Multiset versions of some of the relational algebra operators – given multiset relations r_1 and r_2:

1. $\boldsymbol{\sigma_\theta(r_1)}$**:** If there are c_1 copies of tuple t_1 in r_1, and t_1 satisfies selections σ_θ, then there are c_1 copies of t_1 in $\sigma_\theta(r_1)$.
2. $\boldsymbol{\Pi_A(r_1)}$**:** For each copy of tuple t_1 in r_1, there is a copy of tuple $\Pi_A(t_1)$ in $\Pi_A(r_1)$ where $\Pi_A(t_1)$ denotes the projection of the single tuple t_1.
3. $\boldsymbol{r_1 \times r_2}$**:** If there are c_1 copies of tuple t_1 in r_1 and c_2 copies of tuple t_2 in r_2, there are $c_1 \times c_2$ copies of the tuple $t_1.\ t_2$ in $r_1 \times r_2$

Duplicates [2/2]

- Example: Suppose multiset relations r_1 (*A, B*) and r_2 (*C*) are as follows:

  $r_1 = \{(1, a)\ (2,a)\}$ $\quad$ $r_2 = \{(2), (3), (3)\}$

- Then $\Pi_B(r_1)$ would be {(a), (a)}, while $\Pi_B(r_1)$ x r_2 would be

  $\{(a,2), (a,2), (a,3), (a,3), (a,3), (a,3)\}$

- SQL duplicate semantics:

  select $A_1, A_2, ..., A_n$
  from $r_1, r_2, ..., r_m$
  where P

  is equivalent to the *multiset* version of the expression:

$$\prod_{A_1, A_2, \ldots, A_n} (\sigma_P (r_1 \times r_2 \times \ldots \times r_m))$$

Chapter 3: Introduction to SQL

- 3.1 Overview of the SQL Query Language
- 3.2 SQL Data Definition
- 3.3 Basic Structure of SQL Queries
- 3.4 Additional Basic Operations
- 3.5 Set Operations
- 3.6 Null Values
- 3.7 Aggregate Functions
- 3.8 Nested Subqueries
- 3.9 Modification of the Database

Set Operations

- Find courses that ran in Fall 2009 **or** in Spring 2010

(**select** *course_id* **from** *section* **where** *sem* = 'Fall' **and** *year* = 2009)
union
(**select** *course_id* **from** *section* **where** *sem* = 'Spring' **and** *year* = 2010)

- Find courses that ran in Fall 2009 **and** in Spring 2010

(**select** *course_id* **from** *section* **where** *sem* = 'Fall' **and** *year* = 2009)
intersect
(**select** *course_id* **from** *section* **where** *sem* = 'Spring' **and** *year* = 2010)

- Find courses that ran in Fall 2009 **but not in** Spring 2010

(**select** *course_id* **from** *section* **where** *sem* = 'Fall' **and** *year* = 2009)
except
(**select** *course_id* **from** *section* **where** *sem* = 'Spring' **and** *year* = 2010)

section

course_id	*sec_id*	*semester*	*year*	*building*	*room_number*	*time_slot_id*
BIO-101	1	Summer	2009	Painter	514	B
BIO-301	1	Summer	2010	Painter	514	A
CS-101	1	Fall	2009	Packard	101	H
CS-101	1	Spring	2010	Packard	101	F

Set Operations for Multi Set

- Set operations **union, intersect,** and **except**
  - Each of the above operations automatically eliminates duplicates
- To retain all duplicates, use the corresponding multiset versions **union all, intersect all** and **except all.**

- Suppose a tuple occurs m times in r and n times in s, then, it occurs:
  - $m + n$ times in r **union all** s
  - $\min(m,n)$ times in r **intersect all** s
  - $\max(0, m - n)$ times in r **except all** s

Chapter 3: Introduction to SQL

- 3.1 Overview of the SQL Query Language
- 3.2 SQL Data Definition
- 3.3 Basic Structure of SQL Queries
- 3.4 Additional Basic Operations
- 3.5 Set Operations
- <u>3.6 Null Values</u>
- 3.7 Aggregate Functions
- 3.8 Nested Subqueries
- 3.9 Modification of the Database

Null Values

- It is possible for tuples to have a null value, denoted by *null*, for some of their attributes
- *null* signifies an unknown value or that a value does not exist.
- The result of any arithmetic expression involving *null* is *null*
  - Example: 5 + *null* returns null
- The predicate **is null** can be used to check for null values.
  - Example: Find all instructors whose salary is null.

select *name*
from *instructor*
where *salary* **is null**

instructor

ID	*name*	*dept_name*	*salary*
22222	Einstein	Physics	95000
12121	Wu	Finance	90000
32343	El Said	History	60000
45565	Katz	Comp. Sci.	75000
98345	Kim	Elec. Eng.	80000
76766	Crick	Biology	72000
10101	Srinivasan	Comp. Sci.	65000
58583	Califieri	History	62000
83821	Brandt	Comp. Sci.	92000
15151	Mozart	Music	40000
33456	Gold	Physics	87000
76543	Singh	Finance	80000

Null Values and Three Valued Logic

- Any comparison with *null* returns *unknown*
  - Example*: 5 < null   or   null <> null   or   null = null*
- Three-valued logic using the truth value *unknown*:
  - OR: (*unknown* **or** *true*)   = *true*,
    (*unknown* **or** *false*) = *unknown*
    (*unknown* **or** *unknown) = unknown*
  - AND: *(true* **and** *unknown) = unknown,*
    (false **and** *unknown) = false,*
    (unknown **and** *unknown) = unknown*
  - NOT*: (***not** *unknown) = unknown*
  - "*P* **is unknown**" evaluates to true if predicate *P* evaluates to *unknown*
- Result of **where** clause predicate is treated as *false* if it evaluates to *unknown*

Chapter 3: Introduction to SQL

- 3.1 Overview of the SQL Query Language
- 3.2 SQL Data Definition
- 3.3 Basic Structure of SQL Queries
- 3.4 Additional Basic Operations
- 3.5 Set Operations
- 3.6 Null Values
- 3.7 Aggregate Functions
- 3.8 Nested Subqueries
- 3.9 Modification of the Database

Aggregate Functions [1/3]

- These functions operate on the multiset of values of a column of a relation, and return a value

  avg: average value
  min: minimum value
  max: maximum value
  sum: sum of values
  count: number of values

- Find the average salary of instructors in the Computer Science department
  - **select avg** (*salary*)
    from *instructor*
    where *dept_name*= 'Comp. Sci.';
- Find the total number of instructors who teach a course in the Spring 2010 semester
  - **select count** (**distinct** *ID*)
    from *teaches*
    where *semester* = 'Spring' **and** *year* = 2010;
- Find the number of tuples in the *course* relation
  - **select count** (*)
    from *course*;

Figure 3.16

dept_name	*count*
Comp. Sci.	3
Finance	1
History	1
Music	1

Aggregate Functions – Group By [2/3]

- Find the average salary of instructors in each department
  - **select** *dept_name*, **avg** (*salary*) **as** *avg_salary*
    from *instructor*
    group by *dept_name*;

Figure 3.14: Instructors grouped by the dept_name attribute

ID	*name*	*dept_name*	*salary*
76766	Crick	Biology	72000
45565	Katz	Comp. Sci.	75000
10101	Srinivasan	Comp. Sci.	65000
83821	Brandt	Comp. Sci.	92000
98345	Kim	Elec. Eng.	80000
12121	Wu	Finance	90000
76543	Singh	Finance	80000
32343	El Said	History	60000
58583	Califieri	History	62000
15151	Mozart	Music	40000
33456	Gold	Physics	87000
22222	Einstein	Physics	95000

Figure 3.15: Find the average salary in each department

dept_name	avg_salary
Biology	72000
Comp. Sci.	77333
Elec. Eng.	80000
Finance	85000
History	61000
Music	40000
Physics	91000

Aggregation Functions [3/3]

- Attributes in **select** clause outside of aggregate functions must appear in **group by** list
  - /* erroneous query */
    select *dept_name*, *ID*, **avg** (*salary*)
    from *instructor*
    group by *dept_name*;
- Find the names and average salaries of all departments whose average salary is greater than 42000

select *dept_name*, **avg** (*salary*)
from *instructor*
group by *dept_name*
having avg (*salary*) > 42000;

Figure 3.17

dept_name	*avg(salary)*
Physics	91000
Elec. Eng.	80000
Finance	85000
Comp. Sci.	77333
Biology	72000
History	61000

Note: predicates in the **having** clause are applied after the formation of groups whereas predicates in the **where** clause are applied before forming groups

Null Values and Aggregates

- Total all salaries

  select sum (*salary*)
  from *instructor*

  - Above statement ignores null amounts
  - Result is *null* if there is no non-null amount
- All aggregate operations except **count(*)** ignore tuples with null values on the aggregated attributes
- What if collection has only null values?
  - count returns 0
  - all other aggregates return null

Chapter 3: Introduction to SQL

- 3.1 Overview of the SQL Query Language
- 3.2 SQL Data Definition
- 3.3 Basic Structure of SQL Queries
- 3.4 Additional Basic Operations
- 3.5 Set Operations
- 3.6 Null Values
- 3.7 Aggregate Functions
- 3.8 Nested Subqueries
- 3.9 Modification of the Database

Nested Subqueries

- SQL provides a mechanism for the nesting of subqueries.
- A **subquery** is a **select-from-where** expression that is nested within another query.
- A common use of subqueries is to perform tests for set membership, set comparisons, and set cardinality.

- Find courses offered in Fall 2009 and in Spring 2010

```
select distinct course_id
from section
where semester = 'Fall' and year= 2009 and
        course_id in (select course_id
                      from section
                      where semester = 'Spring' and year= 2010);
```

- Find courses offered in Fall 2009 but not in Spring 2010

```
select distinct course_id
from section
where semester = 'Fall' and year= 2009 and
        course_id  not in (select course_id
                           from section
                           where semester = 'Spring' and year= 2010);
```

Example Query

- Find the total number of (distinct) students who have taken course sections taught by the instructor with *ID* 10101

> **select count** (**distinct** *ID*)
> **from** *takes*
> **where** (*course_id*, *sec_id*, *semester*, *year*) **in**
> (**select** *course_id*, *sec_id*, *semester*, *year*
> **from** *teaches*
> **where** *teaches*.*ID*= 10101);

- Note: Above query can be written in a much simpler manner. The formulation above is simply to illustrate SQL features.

10101	CS-315	1	Spring	2010
10101	CS-347	1	Fall	2009
12121	FIN-201	1	Spring	2010

Set Comparison

- Find names of instructors with salary greater than that of some (at least one) instructor in the Biology department.

select distinct *T.name*
from *instructor* **as** *T*, *instructor* **as** *S*
where *T.salary* > *S.salary* **and** *S.dept name* = 'Biology';

- Same query using > **some** clause

select *name*
from *instructor*
where *salary* > **some** (**select** *salary*
from *instructor*
where *dept name* = 'Biology');

Definition of Some Clause

- F <comp> **some** *r* $\Leftrightarrow$ $\exists\, t \in r$ such that (F <comp> *t*)
  Where <comp> can be: $<, \leq, >, =, \neq$

(5 < **some** $\begin{array}{|c|}\hline 0 \\ \hline 5 \\ \hline 6 \\ \hline \end{array}$) = true (read: 5 < some tuple in the relation)

(5 < **some** $\begin{array}{|c|}\hline 0 \\ \hline 5 \\ \hline \end{array}$) = false

(5 = **some** $\begin{array}{|c|}\hline 0 \\ \hline 5 \\ \hline \end{array}$) = true

(5 $\neq$ **some** $\begin{array}{|c|}\hline 0 \\ \hline 5 \\ \hline \end{array}$) = true (since 0 $\neq$ 5)

(= **some**) $\equiv$ **in** However, ($\neq$ **some**) $\not\equiv$ **not in**

Example Query with > all

- Find the names of all instructors whose salary is greater than the salary of all instructors in the Biology department.

select *name*
from *instructor*
where *salary* > **all** (**select** *salary*
from *instructor*
where *dept name* = ’Biology’);

Definition of all Clause

- F <comp> **all** *r* $\Leftrightarrow$ $\forall\, t \in r$ (F <comp> *t*)

$$(5 < \textbf{all}\ \begin{array}{|c|}\hline 0 \\ \hline 5 \\ \hline 6 \\ \hline \end{array}\ ) = \text{false}$$

$$(5 < \textbf{all}\ \begin{array}{|c|}\hline 6 \\ \hline 10 \\ \hline \end{array}\ ) = \text{true}$$

$$(5 = \textbf{all}\ \begin{array}{|c|}\hline 4 \\ \hline 5 \\ \hline \end{array}\ ) = \text{false}$$

$$(5 \neq \textbf{all}\ \begin{array}{|c|}\hline 4 \\ \hline 6 \\ \hline \end{array}\ ) = \text{true (since } 5 \neq 4 \text{ and } 5 \neq 6)$$

($\neq$ **all**) $\equiv$ **not in**   However, (= **all**) $\not\equiv$ **in**

Test for Empty Relations

- The **exists** construct returns the value **true** if the argument subquery is nonempty.
- **exists** $r \Leftrightarrow r \neq \varnothing$
- **not exists** $r \Leftrightarrow r = \varnothing$

- Yet another way of specifying the query "Find all courses taught in both the Fall 2009 semester and in the Spring 2010 semester"

```
select course_id
from section as S
where semester = 'Fall' and year = 2009 and
        exists (select *
                from section as T
                where semester = 'Spring' and year= 2010
                      and S.course_id = T.course_id);
```

- **Correlated subquery**
- **Correlation name** or **correlation variable**

Example Query with Not Exists

- Find all students who have taken all courses offered in the Biology department.

```
select distinct S.ID, S.name
from student as S
where not exists ( (select course_id
                    from course
                    where dept_name = 'Biology')
                  except
                    (select T.course_id
                     from takes as T
                     where S.ID = T.ID));
```

- First nested query lists all courses offered in Biology
- Second nested query lists all courses a particular student took

- Note that $X - Y = \emptyset \iff X \subseteq Y$
- *Note:* Cannot write this query using = **all** and its variants

Test for Absence of Duplicate Tuples

- The **unique** construct tests whether a subquery has any duplicate tuples in its result.
- The **unique** construct evaluates to "true" on an empty set.
- Find all courses that were offered at most once in 2009

select *T*.*course_id*
from *course* **as** *T*
where unique (**select** *R*.*course_id*
from *section* **as** *R*
where *T*.*course_id*= *R*.*course_id*
and *R*.*year* = 2009);

Subqueries in the Form Clause

- SQL allows a subquery expression to be used in the **from** clause
- Find the average instructors' salaries of those departments where the average salary is greater than $42,000."

```
select dept_name, avg_salary
 from (select dept_name, avg (salary) as avg_salary
           from instructor
           group by dept_name)
 where avg_salary > 42000;
```

- Note that we do not need to use the **having** clause
- Another way to write above query

```
select dept_name, avg_salary
 from (select dept_name, avg (salary)
           from instructor
           group by dept_name) as dept_avg (dept_name, avg_salary)
where avg_salary > 42000;
```

Subqueries in the Form Clause (Cont.)

- And yet another way to write it: **lateral** clause

```
select name, salary, avg_salary
 from instructor I1,
          lateral (select avg(salary) as avg_salary
                   from instructor I2
                   where I2.dept_name= I1.dept_name);
```

- Note: lateral is part of the SQL standard, but is not supported on many database systems; some databases such as SQL Server offer alternative syntax

Example Query with "With Clause"

- The **with** clause provides a way of defining a temporary relation whose definition is available only to the query in which the **with** clause occurs.
- Find all departments with the maximum budget

```
with max_budget (value) as
        (select max(budget)
         from department)
select budget
from department, max_budget
where department.budget = max_budget.value;
```

Complex Queries using With Clause

- Find all departments where the total salary is greater than the average of the total salary at all departments

```
with dept _total (dept_name, value) as
            (select dept_name, sum(salary)
             from instructor
             group by dept_name),
      dept_total_avg(value) as
          (select avg(value)
           from dept_total)
select dept_name
from dept_total, dept_total_avg
where dept_total.value >= dept_total_avg.value;
```

Scalar Subquery

- Scalar subquery is one which is used where a single value is expected

```
select dept_name,
          (select count(*)
            from instructor
            where department.dept_name = instructor.dept_name)
          as num_instructors
from department ;
```

- Runtime error if subquery returns more than one result tuple

Chapter 3: Introduction to SQL

- 3.1 Overview of the SQL Query Language
- 3.2 SQL Data Definition
- 3.3 Basic Structure of SQL Queries
- 3.4 Additional Basic Operations
- 3.5 Set Operations
- 3.6 Null Values
- 3.7 Aggregate Functions
- 3.8 Nested Subqueries
- <u>3.9 Modification of the Database</u>

Modification of the Database

- Deletion of tuples from a given relation.
- Insertion of new tuples into a given relation
- Updating of values in some tuples in a given relation

Deletion [1/2]

- Delete all instructors

  delete from *instructor*

- Delete all instructors from the Finance department

  delete from *instructor*
  where *dept_name*= 'Finance';

- Delete all tuples in the *instructor* relation for those instructors associated with a department located in the Watson building.

  delete from *instructor*
  where *dept name* **in** (**select** *dept name*
  from *department*
  where *building* = 'Watson');

instructor

ID	*name*	*dept_name*	*salary*
22222	Einstein	Physics	95000
12121	Wu	Finance	90000
32343	El Said	History	60000
45565	Katz	Comp. Sci.	75000

Deletion [2/2]

- Delete all instructors whose salary is less than the average salary of instructors

delete from *instructor*
where *salary* < (**select avg** (*salary*) **from** *instructor*);

- Problem: as we delete tuples from deposit, the average salary changes
- Solution used in SQL:
  1. First, compute **avg** salary and find all tuples to delete

  2. Next, delete all tuples found above (without recomputing **avg** or retesting the tuples)

Insertion [1/2]

- Add a new tuple to *course*

  insert into *course*
  values (’CS-437’, ’Database Systems’, ’Comp. Sci.’, 4);

- or equivalently

  insert into *course* (*course_id*, *title*, *dept_name*, *credits*)
  values (’CS-437’, ’Database Systems’, ’Comp. Sci.’, 4);

- Add a new tuple to *student* with *tot_creds* set to null

  insert into *student*
  values (’3003’, ’Green’, ’Finance’, *null*);

course

course_id	*title*	*dept_name*	*credits*
BIO-101	Intro. to Biology	Biology	4
BIO-301	Genetics	Biology	4
BIO-399	Computational Biology	Biology	3
CS-101	Intro. to Computer Science	Comp. Sci.	4

student

ID	*name*	*dept_name*	*tot_cred*
00128	Zhang	Comp. Sci.	102
12345	Shankar	Comp. Sci.	32
19991	Brandt	History	80
23121	Chavez	Finance	110

Insertion [2/2]

- Add all instructors to the *student* relation with tot_creds set to 0

  insert into *student*
  select *ID, name, dept_name, 0*
  from *instructor*

- The **select from where** statement is evaluated fully before any of its results are inserted into the relation.

  Otherwise queries like

  insert into *table*1 **select** * **from** *table*1

  would cause problem

Updates

- Increase salaries of instructors whose salary is over $100,000 by 3%, and all others receive a 5% raise
  - Write two **update** statements:

    update *instructor*
    set *salary* = *salary* * 1.03
    where *salary* > 100000;
    update *instructor*
    set *salary* = *salary* * 1.05
    where *salary* <= 100000;

  - The order is important

- Same query as before but with case statement

  update *instructor*
  set *salary* = **case**
  when *salary* <= 100000 **then** *salary* * 1.05
  else *salary* * 1.03
  end

Updates with Scalar Subqueries

- Recompute and update tot_creds value for all students

```
update student S
   set tot_cred = ( select sum(credits)
                    from takes natural join course
                    where S.ID= takes.ID and
                          takes.grade <> 'F' and
                          takes.grade is not null);
```

- Sets *tot_creds* to null for students who have not taken any course
- Instead of **sum**(*credits*), use:

```
case
    when sum(credits) is not null then sum(credits)
    else 0
  end
```

takes
