

Chapter 4: Intermediate SQL

Database System Concepts, 6th Ed.

©Silberschatz, Korth and Sudarshan

See www.db-book.com for conditions on re-use

Chapter 4: Intermediate SQL

- Join Expressions
- Views
- Transactions
- Integrity Constraints
- SQL Data Types and Schemas
- Authorization

Joined Relations

- **Join operations** take two relations and return as a result another relation.
- A join operation is a **Cartesian product followed by Selection**.
- The join operations are typically used as subquery expressions in the **from** clause

Additional Join Operations

- **Join operations** take two relations and return as a result another relation.
- **Join condition** – defines which tuples in the two relations match, and what attributes are present in the result of the join
 - Natural 이 붙는 경우, on <predicate> 이 붙는 경우, using이 붙는 경우
- **Join type** – defines how tuples in each relation that do not match any tuple in the other relation (based on the join condition) are treated.

<i>Join types</i>
inner join
left outer join
right outer join
full outer join

<i>Join Conditions</i>
natural
on <predicate>
using (A_1, A_2, \dots, A_n)

- **Outer Join**
 - An extension of the join operation that **avoids loss of information**.
 - Computes the join and then adds tuples from one relation that does not match tuples in the other relation to the result of the join.
 - Uses **null values**.

Left Outer Join

- Relation *course*

Views

- In some cases, it is not desirable for all users to see the entire logical model (that is, all the actual relations stored in the database.)
- Consider a person who needs to know an instructors name and department, but not the salary. This person should see a relation described, in SQL, by

```
select ID, name, dept_name  
from instructor
```

- A **view** provides a mechanism to hide certain data from the view of certain users.
- Any relation that is not of the conceptual model but is made visible to a user as a “virtual relation” is called a **view**.

View Definition

- A view is defined using the **create view** statement which has the form

create view v as < query expression >

where <query expression> is any legal SQL expression.

The view name is represented by v .

- Once a view is defined, the view name can be used to refer to **the virtual relation** that the view generates.
- **View definition is not the same as creating a new relation** by evaluating the query expression
 - Rather, a view definition causes **the saving of an expression**; the expression is substituted into queries using the view.

Example Views

- A view of instructors without their salary

create view *faculty* as

```
select ID, name, dept_name
from instructor
```

- Find all instructors in the Biology department

select *name*

from *faculty*

where *dept_name* = 'Biology'

- Create a view of department salary totals

create view *departments_total_salary(dept_name, total_salary)* as

```
select dept_name, sum (salary)
from instructor
```

group by *dept_name*;

instructor			
<i>ID</i>	<i>name</i>	<i>dept_name</i>	<i>salary</i>
10101	Srinivasan	Comp. Sci.	65000
12121	Wu	Finance	90000
15151	Mozart	Music	40000
22222	Einstein	Physics	95000
32343	El Said	History	60000
32456	Goddard	Physics	67000

Views Defined Using Other Views

- One view may be used in the expression defining another view
- A view relation v_1 is said to *depend directly* on a view relation v_2 if v_2 is used in the expression defining v_1
- A view relation v_1 is said to *depend on* view relation v_2 if either v_1 depends directly to v_2 or there is a path of dependencies from v_1 to v_2
- A view relation v is said to be *recursive* if it depends on itself.
- View Expansion
 - Let view v_1 be defined by *an expression e_1* that may itself contain uses of view relations.
 - View expansion of an expression repeats the following step:
repeat
 - Find any view relation v_i in e_1
 - Replace the view relation v_i by the expression defining v_i**until** no more view relations are present in e_1
 - As long as the view definitions are not recursive, this loop will terminate

Views Defined Using Other Views

- **create view physics_fall_2009 as**
select course.course_id, sec_id, building, room_number
from course, section
where course.course_id = section.course_id
and course.dept_name = 'Physics'
and section.semester = 'Fall'
and section.year = '2009';
- **create view physics_fall_2009_watson as**
select course_id, room_number
from physics_fall_2009
where building= 'Watson';
- View Expansion
create view physics_fall_2009_watson as
(select course_id, room_number
from (select course.course_id, building, room_number
from course, section
where course.course_id = section.course_id
and course.dept_name = 'Physics'
and section.semester = 'Fall'
and section.year = '2009')
where building= 'Watson');

Figure 2.02: The Course relation

course_id	title	dept_name	credits
BIO-101	Intro. to Biology	Biology	4
BIO-301	Genetics	Biology	4
BIO-399	Computational Biology	Biology	3
CS-101	Intro. to Computer Science	Comp. Sci.	4

Figure 2.06: The Section relation

course_id	sec_id	semester	year	building	room_number	time_slot_id
BIO-101	1	Summer	2009	Painter	514	B
BIO-301	1	Summer	2010	Painter	514	A
CS-101	1	Fall	2009	Packard	101	H
CS-101	1	Spring	2010	Packard	101	F
CS-190	1	Spring	2009	Taylor	3128	E

Update of a View

- Faculty view on instructor relation

create view *faculty* as

```
select ID, name, dept_name  
from instructor
```

- Add a new tuple to *faculty* view

```
insert into faculty values ('30765', 'Green', 'Music');
```

This insertion must be represented by the insertion of the tuple

```
('30765', 'Green', 'Music', null)
```

into **the *instructor* relation**

Some Updates cannot be Translated Uniquely

- ```
create view instructor_info as
 select ID, name, building
 from instructor, department
 where instructor.dept_name= department.dept_name;
```
- ```
insert into instructor_info values ('69987', 'White', 'Taylor');
```

 - which department, if multiple departments in Taylor?
 - what if no department is in Taylor?
- Most SQL implementations allow updates only on simple views
 - The **from** clause has only one database relation.
 - The **select** clause contains only attribute names of the relation, and does not have any expressions, aggregates, or **distinct** specification.
 - Any attribute not listed in the **select** clause can be set to null
 - The query does not have a **group by** or **having** clause.

Figure 4.07: Relations *instructor* and *department* after insertion of tuples

<i>ID</i>	<i>name</i>	<i>dept_name</i>	<i>salary</i>
10101	Srinivasan	Comp. Sci.	65000
12121	Wu	Finance	90000
15151	Mozart	Music	40000
22222	Einstein	Physics	95000
32343	El Said	History	60000
33456	Gold	Physics	87000

83821	Brandt	Comp. Sci.	92000
98345	Kim	Elec. Eng.	80000
69987	White	<i>null</i>	<i>null</i>

instructor

<i>dept_name</i>	<i>building</i>	<i>budget</i>
Biology	Watson	90000
Comp. Sci.	Taylor	100000
Elec. Eng.	Taylor	85000
Finance	Painter	120000
History	Painter	50000
Music	Packard	80000
Physics	Watson	70000
<i>null</i>	Taylor	<i>null</i>

department

Some view updates are not at all possible for translation to relation

- Instructor (ID, name, department, salary)
- `create view history_instructors as
select *
from instructor
where dept_name= 'History';`
- What happens if we insert ('25566', 'Brown', 'Biology', 100000) into *history_instructors*?

Materialized Views

- Some DBMS allows view relations to be stored

```
CREATE MATERIALIZED VIEW MV_MY_VIEW
```

```
REFRESH FAST START WITH SYSDATE
```

```
NEXT SYSDATE + 1
```

```
AS SELECT * FROM <table_name>;
```

- **Materialized view**: create a physical table containing all the tuples in the result of the query defining the view
- Materialized view is kept up-to-date
 - If relations used in the query are updated, the materialized view result becomes out of date
 - Need to **maintain** the view, by updating the view whenever the underlying relations are updated.

Transactions

- Unit of work
 - Atomic transaction
 - either fully executed or rolled back as if it never occurred
 - Isolation from concurrent transactions
 - Transactions begin implicitly
 - Ended by **commit work** or **rollback work**
 - But default on most databases: each SQL statement commits automatically
 - Can turn off auto commit for a session (e.g. using API)
 - In SQL:1999, can use:

```
begin atomic
  ...
end
```
- ▶ Not supported on most databases

Integrity Constraints

- Integrity constraints guard against accidental damage to the database, by ensuring that authorized changes to the database do not result in a loss of data consistency.
 - A checking account must have a balance greater than \$10,000.00
 - A salary of a bank employee must be at least \$4.00 an hour
 - A customer must have a (non-null) phone number
- Integrity Constraints on a Single Relation
 - **not null**
 - **primary key**
 - **unique**
 - **check (P)**, where P is a predicate

SQL Statements for Integrity Constraints

- **not null**: Declare *name* and *budget* to be **not null**

name varchar(20) not null

budget numeric(12,2) not null

- **unique (A_1, A_2, \dots, A_m)**

- The attributes A_1, A_2, \dots, A_m form a candidate key.
- Candidate keys are permitted to be null (in contrast to primary keys)

- **check (P)**: where P is a predicate

Example: ensure that semester is one of fall, winter, spring or summer:

```
create table section ( course_id varchar (8), sec_id varchar (8),
    semester varchar (6), year numeric (4,0), building varchar (15),
    room_number varchar (7), time_slot_id varchar (4),
    primary key (course_id, sec_id, semester, year),
    check (semester in ('Fall', 'Winter', 'Spring', 'Summer'))
);
```

Referential Integrity

- Ensures that a value that appears in one relation for a given set of attributes also appears for **a certain set of attributes in another relation**.
 - Example: If “Biology” is a department name appearing in one of the tuples in the *instructor* relation, then there exists a tuple in the *department* relation for “Biology”.
 - Let A be a set of attributes.
 - Let R and S be two relations that contain attributes A and where A is the primary key of S.
 - A is said to be a **foreign key** of R if for any values of A appearing in R these values also appear in S.
 - **instructor** relation의 dept_name은 **department** relation의 name 중에서 값을 가져야 하고 (**referential integrity**), **instructor** relation의 dept_name은 **foreign key**라고 한다

Cascading Actions in Referential Integrity

- `create table course (course_id char(5) primary key, title varchar(20), dept_name varchar(20), primary key (course_id)
foreign key (dept_name) references department
on delete cascade
on update cascade,
...
)`

dept_name	building	budget
Biology	Watson	90000
Comp. Sci.	Taylor	100000
Elec. Eng.	Taylor	85000
Finance	Painter	120000
History	Painter	50000
Music	Packard	80000
Physics	Watson	70000
null	Painter	null

department

- If the first tuple in the department relation is deleted, delete all courses of Biology department
- If the Biology department updated the department name into “Bio Technology” department, update the course tuples of Biology department
- alternative actions to **cascade**: **set null**, **set default**

Integrity Constraint Violation During Transactions

```
create table person (
    ID char(10),
    name char(40),
    mother char(10),
    father char(10),
    primary key ID,
    foreign key father references person,
    foreign key mother references person)
```

■ How to insert a tuple without causing constraint violation ?

- insert father and mother of a person before inserting person
- OR, set father and mother to null initially, update after inserting all persons (not possible if father and mother attributes declared to be **not null**)
- OR defer constraint checking
 - ▶ **set constraints <constraint-list> deferred**

Complex Check Clauses and Assertions

- Every section has at least one instructor teaching the section.

check (time_slot_id in (select time_slot_id from time_slot))

- Unfortunately: subquery in check clause not supported by pretty much any DBMS
- Alternative: triggers (later)

- Assertion is a predicate expressing condition that we wish the database always to satisfy

create assertion <assertion-name> check <predicate>;

Built-in Data Types in SQL

- **date:** Dates, containing a (4 digit) year, month and date
 - Example: **date** '2005-7-27'
- **time:** Time of day, in hours, minutes and seconds.
 - Example: **time** '09:00:30' **time** '09:00:30.75'
- **timestamp:** date plus time of day
 - Example: **timestamp** '2005-7-27 09:00:30.75'
- **interval:** period of time
 - Example: **interval** '1' day
 - Subtracting a **date/time/timestamp** value from another gives an interval value
 - Interval values can be added to date/time/timestamp values

Index Creation

- **create table student**

```
( ID  varchar (5),  
  name  varchar (20) not null,  
  dept_name  varchar (20),  
  tot_cred  numeric (3,0) default 0,  
  primary key (ID))
```

- **create index studentID_index on student(ID)**

- Indices are data structures used to speed up access to records with specified values for index attributes

- e.g. **select ***

```
from student  
where ID = '12345'
```

can be executed by using the index to find the required record, without looking at all records of *student*

(More on indices in Chapter 11)

User-Defined Types and Domains

- **create type** construct in SQL creates user-defined type

```
create type Dollars as numeric (12,2) final
```

```
create table department
```

```
( dept_name  varchar (20),  
  building     varchar (15),  
  budget       Dollars);
```

- **create domain** construct in SQL-92 creates user-defined domain types

```
create domain person_name char(20) not null
```

- Types and domains are similar.

- Domains can have constraints, such as **not null**, specified on them.

```
create domain degree_level varchar(10)  
constraint degree_level_test  
check (value in ('Bachelors', 'Masters', 'Doctorate'));
```

Large-Object Types

- Large objects (photos, videos, CAD files, etc.) are stored as *a large object*:
 - **blob**: binary large object -- object is a large collection of uninterpreted binary data (whose interpretation is left to an application outside of the database system)
 - **clob**: character large object -- object is a large collection of character data
 - When a query returns a large object, *a pointer is returned* rather than the large object itself.
- Attributes having large objects
 - book_review clob(10KB)
 - image blob(10MB)
 - movie blob(2GB)

Authorization

Forms of authorization on **data in the database**:

- **Read** - allows reading, but not modification of data.
- **Insert** - allows insertion of new data, but not modification of existing data.
- **Update** - allows modification, but not deletion of data.
- **Delete** - allows deletion of data.

Forms of authorization to **modify the database schema**

- **Index** - allows creation and deletion of indices.
- **Resources** - allows creation of new relations.
- **Alteration** - allows addition or deletion of attributes in a relation.
- **Drop** - allows deletion of relations.

Forms of Authorization → Privilege List

Authorization Specification in SQL

- The **grant** statement is used to confer authorization

```
grant <privilege list>
    on <relation name or view name>
    to <user list>
```

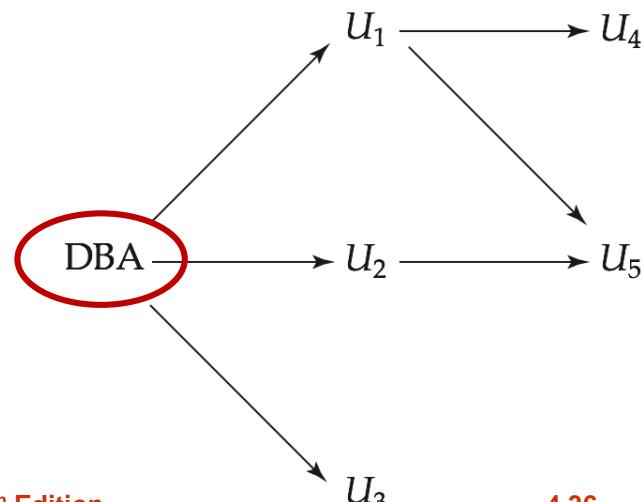

- <user list> is:
 - user-id**
 - public**, which allows all valid users the privilege granted
 - A **role** (more on this later)
- Granting a privilege on a view does not imply granting any privileges on the underlying relations.
- The grantor of the privilege must already hold the privilege on the specified item (or be the database administrator).

Privileges in SQL

- **select**: allows read access to relation, or the ability to query using the view
 - Example: grant users U_1 , U_2 , and U_3 **select** authorization on the *instructor* relation:
$$\text{grant select on instructor to } U_1, U_2, U_3$$
- **insert**: the ability to insert tuples
- **update**: the ability to update using the SQL update statement
- **delete**: the ability to delete tuples.
- **all privileges**: used as a short form for all the allowable privileges

Figure 4.10: Authorization-grant graph

Revoking Authorization in SQL

- The **revoke** statement is used to revoke authorization.

revoke <privilege list>

on <relation name or view name>

from <user list>

- Example:

revoke select on branch from U_1, U_2, U_3

- <privilege-list> may be **all** to revoke all privileges the revoker may hold.
- If <revoker-list> includes **public**, all users lose the privilege except those granted it explicitly.
- If the same privilege was granted twice to the same user by different grantees, the user may retain the privilege after the revocation.
- All privileges that depend on the privilege being revoked are also revoked.

Roles (Group rather than Individual)

- **Role = Virtual Group of Persons**

- **create role** instructor_group;

instructor_group

- **grant** *instructor* **to** Amit;

- Privileges can be granted to roles:

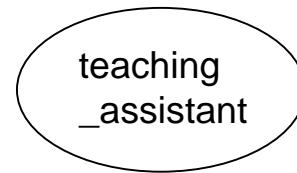

- **grant select on takes to** *instructor*;

- Roles can be granted to users, as well as to other roles

- **create role** teaching_assistant

- **grant teaching_assistant to** *instructor*;

- ▶ *Instructor* inherits all privileges of *teaching_assistant*

teaching
_assistant

- Chain of roles

- **create role** dean;

dean

- **grant** *instructor* **to** dean;

- **grant** dean **to** Satoshi;

Authorization on Views

- Geology학과의 geo_staff이 있다고 하자

- create view geo_instructor as

```
(select *
  from instructor
  where dept_name = 'Geology');
```

- Suppose the creator of geo_instructor issues

```
grant select on geo_instructor to geo_staff
```

- Suppose that a geo_staff member issues

- select *
 - from geo_instructor;

- 이경우 geo_staff이 instructor relation에 대해서 query 권한이 없고, geo_instructor view를 만든 사람이 instructor relation에 대해서 권한이 없다면 → geo_staff은 geo_instructor view에 query를 할수 없다.

- geo_instructor view에 대한 query를 하기 위해서는 instructor에 대해서 query를 해야 하므로

ID	name	dept_name	salary
10101	Srinivasan	Comp. Sci.	65000
12121	Wu	Finance	90000
15151	Mozart	Music	40000
22222	Einstein	Physics	95000
32343	El Said	History	60000
33456	Gold	Physics	87000
45565	Katz	Comp. Sci.	75000
58583	Califieri	History	62000
76543	Singh	Finance	80000
76766	Crick	Biology	72000
83821	Brandt	Comp. Sci.	92000
98345	Kim	Elec. Eng.	80000
69987	White	null	null

instructor

geo_staff

Other Authorization Features

- Authorization of schema modification
 - **grant reference (dept_name) on department to Mariano;**
 - Mario는 새로운 relation을 define하면서 attribute를 department relation의 dept_name을 foreign key의 domain으로 선언할 수 있다
- Grant grant-privileges vs Revoke grant-privileges
 - Privilege를 받은 user들이 다른 user들에게 grant privilege를 행사
 - ▶ **grant select on department to Amit with grant option;**
 - User에게 grant했던 privilege를 revoke하고 다른 user들에게 privilege가 grant되었었다면 cascadingly revoke
 - ▶ **revoke select on department from Amit, Satoshi cascade;**
 - User에게 grant했던 privilege만을 revoke하도록 restrict
 - ▶ **revoke select on department from Amit, Satoshi restrict;**

■ Etc. read Section 4.6 for more details we have omitted here.
